

IN THE SPECIFICATION:

Pages 4 and 5, amend the paragraph starting on Page 4 at line 13 and ending on Page 5 at line 1 as follows:

[0013] In another preferred embodiment, one of the tube sections of the hose system is advantageously designed in the form of a horizontally extending semicircle, located at the level of the neck part of the safety clothing. If the semicircle is made porous in its upper area, i.e., directed toward the head of the user, and it is sealed in its lower area, i.e., directed toward the lower part of the body as viewed by the user, the breathing air rises upward from the tube section designed as a semicircle with a low velocity of flow and thus directly to the breathing ~~organs~~organs, mouth and ~~nose~~nose, of the user. Another advantage that arises is that the visor is exposed to a flow of dry air and the visor is thus effectively prevented from fogging.
